

Per gene, alternative exons are more disordered than constitutive — in both TFs and non-TFs

One point per gene (mean per-exon `idr_frac` of its alternative vs constitutive unique exons); genes with ≥ 1 of each. $n = 4,038$ genes (307 TF, 3,731 non-TF). Paired within gene $\rightarrow$ Wilcoxon signed-rank, one-sided. Significance: * $P < 0.05$, ** $P < 0.01$, *** $P < 0.001$.
